

In our current application in the toolbar we have a trident button

Which performs a process from behind that transforms several nodes, this process returns a new XML with the entire document already transformed. In the current application we reload the XML with which the process returns us and we update the document.

With XEditor we have put the button in the Toolbar and we have invoked the process that returns the XML that we need to reload, **but we do not know in which property of the editor we must assign that XML and later how to update the Editor so that the XML and the Document are refreshed.**

We have tried using the "documentHTML" property but it is obviously not the right property to refresh our XML.

Could you tell us how to solve this problem.

On the other hand, within the Toolbar we have the "icon" property to assign an icon, but I really want to assign the same image that I already have, which does not exist within the fontawesome icons. I have tried with:

```
image: 'http://es006-ppdapp001:8080/Helios2/images/neptuno.png',
```

```
o
```

```
icon: 'http://es006-ppdapp001:8080/Helios2/images/neptuno.png',
```

But it is not correct,

Is there any other property that allows me to put my image?
